I D A H O

MT. BAKER

Mt. Baker volcano is an active volcano that has erupted explosively in the past and is currently releasing steam and gases. The permanent snow and ice cover on the volcano's upper slopes and flanks which overlies an active hydrothermal system, is the source of numerous hot springs and fumaroles. The most spectacular of these is the Sherman Crater fumarole field, which is located on the summit of the volcano. Mt. Baker is also the location of the Sulphur Creek hot springs. Temperatures of the Sherman Crater fumaroles are as high as 280°C. Mt. Baker is considered a potentially dangerous volcano.

MT. RAINIER

Mt. Rainier is the largest glacier-clad volcano in the conterminous United States. Its permanent snow and ice cover overlies an active hydrothermal system that is the source of numerous hot springs and fumaroles. The most spectacular of these is the Summit Creek fumarole field, which is located on the summit of the volcano. Temperatures of the Summit Creek fumaroles are as high as 90°C. Mt. Rainier is considered a potentially dangerous volcano.

MT. ADAMS

Mt. Adams is a massive, ice-clad volcano that has erupted explosively in the past and is considered potentially dangerous. The permanent snow and ice cover on the volcano's upper slopes and flanks which overlies an active hydrothermal system, is the source of numerous hot springs and fumaroles. The most spectacular of these is the Steamboat fumarole field, which is located on the summit of the volcano. Temperatures of the Steamboat fumaroles are as high as 90°C.

MT. ST. HELENS

Mt. St. Helens is a young, ice-clad volcano that erupted explosively in 1980 and 1981. Its permanent snow and ice cover overlies an active hydrothermal system that is the source of numerous hot springs and fumaroles. The most spectacular of these is the Loowit fumarole field, which is located on the summit of the volcano. Temperatures of the Loowit fumaroles are as high as 90°C. Mt. St. Helens is considered a potentially dangerous volcano.

INDIAN HEAVEN KGRA

The Indian Heaven Known Geothermal Resource Area (KGRA) is located on the northeastern flank of Indian Heaven volcanic field. The KGRA was designated by the U.S. Department of Energy, Washington Geothermal Development Council, Oregon Institute of Technology, and Washington Division of Geology and Earth Resources. Geologic, geochemical, geophysical, and geothermal studies leading to the drilling of three temperature-gradient and exploration holes, completed in spring 1981. Encouraging findings include: a temperature-gradient hole at 180 m in one well and at a shorter zone at 150 m producing 1980 L/min at 37°C from another well. Analysis of the data received from this shallow drilling program will be used in the planning of a deeper exploration-production well.

MT. HOOD

Mt. Hood is a massive, ice-clad volcano that has erupted explosively in the past and is considered potentially dangerous. The permanent snow and ice cover on the volcano's upper slopes and flanks which overlies an active hydrothermal system, is the source of numerous hot springs and fumaroles. The most spectacular of these is the Crater Rock fumarole field, which is located on the summit of the volcano. Temperatures of the Crater Rock fumaroles are as high as 90°C. Mt. Hood is considered a potentially dangerous volcano.

NORTH BONNEVILLE

The town of North Bonneville, located close to five thermal springs, is investigating the potential for the development of a geothermal heating district, with assistance from the U.S. Department of Energy, Washington Intergency Geothermal Development Council, Oregon Institute of Technology, and Washington Division of Geology and Earth Resources. Geologic, geochemical, geophysical, and geothermal studies leading to the drilling of three temperature-gradient and exploration holes, completed in spring 1981. Encouraging findings include: a temperature-gradient hole at 180 m in one well and at a shorter zone at 150 m producing 1980 L/min at 37°C from another well. Analysis of the data received from this shallow drilling program will be used in the planning of a deeper exploration-production well.

ST. MARTINS (CARSON) HOT SPRINGS

Recent temperature-gradient drilling suggests a "keyhanom" geothermal gradient of about 80°C/km in this area. A drill hole located near St. Martins Hot Springs has a temperature gradient of 80°C/km and a bottom-hole temperature of 36°C at a depth of 152 m.

HOT LAKE AND POISON LAKE

EPHRATA

The city of Ephrata has developed their own low-temperature geothermal resource for space heating. The system, which was completed in 1982, is designed to serve commercial buildings, and residences. A grant from the Department of Housing and Urban Development (HUD) is helping finance the project. The city is also receiving technical assistance from the Pacific Northwest Laboratory (PNL) in the development of the heating system. The development of the geothermal resource is being carried out by the city's Public Works Department.

COLUMBIA BASIN

The Columbia Basin Irrigation Project is the largest irrigation project in the United States. Water is pumped from the Columbia River at Grand Coulee Dam and distributed to irrigate 1,029,000 acres of land in the Columbia Basin. The project is administered by the Bureau of Reclamation. Geothermal resources may be developed for many applications in the Columbia Basin. Geothermal resources are being investigated by the Washington Division of Geology and Earth Resources and the Pacific Northwest Laboratory. The Washington Division of Geology and Earth Resources has published a report on the geothermal resources of the Columbia Basin.

Scale 1:500,000
1 centimeter equals 5 kilometers
1 inch equals approximately 8 miles

10 0 10 20 30 40 50 Kilometers
10 0 10 20 30 40 Miles

Contour interval 500 feet
National geodetic vertical datum of 1929
1927 North American datum
Lambert conformal conic projection based on standard parallels of 33° and 45°
Base map revised in 1976

Springs and Wells

Thermal wells
- Bottom-hole temperature 20°-50°C
- Bottom-hole temperature higher than 50°C

Thermal springs
- Surface temperature 20°-50°C
- Surface temperature higher than 50°C

Mineral springs
- Surface temperature lower than 20°C. Mineral springs may be diluted and cooled thermal waters.

Total dissolved solids (mg/L) were calculated from measured electrical conductivities (micromhos/cm). TDS = 0.6 (conductivity)

Thermal Waters

Dark Gray Areas. Darker gray area is known or inferred to be underlain by low-temperature (lower than 100°C) to high-temperature (higher than 150°C) thermal water.

Light Gray Areas. Unbounded lighter gray area is favorable for exploration for, and development of, thermal water of sufficient temperature (20°C and higher) for direct heat applications

In the Cascade Range physiographic province low-temperature to high-temperature resources are indicated by stratovolcanoes and basaltic volcanic fields less than one million years old, geologically young silicic (andesitic and dacitic) volcanic centers, and hot springs and fumaroles. The Cascades geothermal systems have the best potential for high-temperature development in Washington. In southeastern Washington (generally the Columbia Basin physiographic province) light gray area includes wells with bottom-hole temperatures of 20°C and higher, and gradients higher than 45°C/km. Here, although neither temperatures nor gradients are spectacular, exploitable low-temperature thermal water underlies large areas at shallow depth (less than 1000 m). It is not implied that thermal water will be found everywhere in the gray areas. In southeastern Washington cold wells are interspersed with warm wells. Absence of gray shading does not indicate there is no possibility of finding geothermal resources; it means only that surface and subsurface manifestations are not now known. Ongoing exploration and study will continue to refine the delineation of Washington's geothermal resources.

Regional Heat Flow

▲ Heat flow in milliwatts/meter² (mW/m²)
85 See Blackwell, D.D., 1980, Heat flow and geothermal gradient measurements in Washington up to 1979: Washington Division of Geology and Earth Resources Open-File Report 80-9, 524 p.

Metric Conversion Factors

1 liter = .2642 gallon
1 meter = 3.281 feet
1 milligram/liter = 1 part per million
°Celsius = 5/9 (°Fahrenheit − 32)
°Fahrenheit = 9/5 °Celsius + 32

Known Geothermal Resources Area (KGRA) as designated by the U.S. Department of the Interior. Name in red lettering.
